

Michael & Son SERVICES

Plumbing · Electrical · Heating & AC · Remodeling

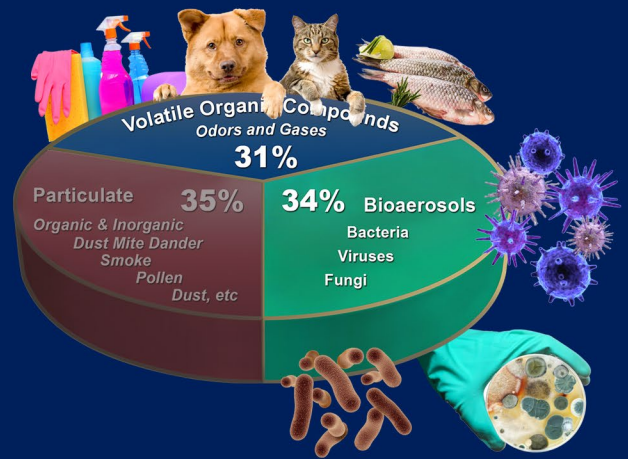

- High output germicidal UVC kills or deactivates germs mold and viruses in a single pass.
- Germicidal UV is the trusted method used in Hospitals.
- Helps reduce the spread of colds and flu.
- Our patented oxidizing chamber uses activated oxygen for odor control.
- Odor control is easily adjustable by the homeowner.
- Helps to eliminate “dirty sock syndrome”.
- Helps keep the equipment cleaner and working more efficiently.
- Lifetime warranty on electronics, 2-year warranty on lamps.
- Remote unit fits tight spaces.
- 2-Year long-life lamps.
- ETL certified

WHAT ARE BIOAEROSOLS?

Bioaerosols are living things: fungi (mold spores) and germs (bacteria & viruses). Pathogens are the germs that cause infectious diseases. Germs and mold spores may be allergens and cause respiratory reactions and ailments. Mold spores are probably the most common bioaerosols.

FORCED AIR FURNACES DISTRIBUTE POLLUTANTS

The air handler provides a perfect environment for the growth and broadcast of bioaerosols, toxins and gases that cause unhealthy air conditions which are found in most homes. Because your HVAC system is the collection point for most of the recirculated air in the building, it is the best place for installing our germicidal UV unit.

We live and breathe in a chemical soup.

Most homes are full of pollutants that can't escape. They are locked inside and people breathe them, suffer from them and need to find a solution for them.
